### Report Overview

Combustion burner combines fuel with an air/gas mixture to achieve controlled combustion inside of the system. Industrial combustion burners are used to facilitate controlled combustion. By combining and then igniting fuel and air/gas, they provide heat that helps achieve and maintain specific temperatures within the combustion chamber, depending on the levels required for the particular process. While all combustion burners operate under the same basic principles?i.e., creating heat energy by burning a mix of fuel and oxygen?they are available in several designs to meet the requirements and restrictions of different industrial applications. These variations may differ in regard to fuel capacities, mixing methods, dissemination methods, and more. All four types use fuel mixed with some form of air or oxygen to produce heat energy. The mixing process can be performed inside of a pre-mix chamber or at the burner nozzle, depending on the needs of the application and the conditions in the surrounding environment.
