Abstracts

Crossed (Cross) roller guide is a precision linear motion guide component that uses precision rollers in a cross arrangement to carry and guide the linear movement of the load. This special design gives it high rigidity, high precision, and multi-directional load bearing capabilities. The basic structure of the crossed roller guide consists of an inner ring, an outer ring, a cage and rollers. The inner ring usually has a V-shaped or arc-shaped groove to accommodate and guide the rollers. The outer ring is also equipped with intersecting V-shaped grooves, which cooperate with the inner ring to form a rolling channel. The rollers are evenly distributed between the inner and outer rings through the cage, and are arranged crosswise in both the radial and axial directions. The function of the cage is to separate the rollers and ensure that they are evenly distributed and do not collide with each other during operation. Features of crossed roller guides: Small rolling friction, good stability; Large contact area and small elastic deformation; There are many effective moving bodies, and it is easy to realize high rigidity and high load movement; Flexible structure design, convenient installation and use, long life; Low mechanical energy consumption, high precision, fast speed and large carrying capacity. Industrial cross roller guides are essential core parts in industrial manufacturing and are widely used. At present, cross roller guides are relatively widely used in the machine tool industry, semiconductor equipment and other markets. There are obvious differences in the demand for cross roller guides in various industrial application fields. Mainly reflected in: High precision demand: In the fields of semiconductor manufacturing, precision machining, etc., cross roller guides equipped with high-precision balls have become the preferred solution for achieving precise displacement and positioning with their extremely low friction coefficient and excellent precision, meeting the market's continuous pursuit of high-precision machining. High rigidity demand: In the face of harsh working conditions such as heavy loads and high-frequency operations, the unique roller arrangement design of the cross roller guide

ensures the stability of the guide system, provides solid support for the stable operation of industrial equipment, and meets the market's urgent demand for high-rigidity guides. Low friction demand: As industrial equipment develops towards high speed and high efficiency, the low friction characteristics of the cross roller guide achieved through the roller rolling mechanism not only improve the operating efficiency of the equipment, but also effectively reduce energy loss and extend service life, meeting the market's expectations for low friction guides. Complex processing needs: As the manufacturing industry develops towards high-end fields such as multi-axis and composite processing, cross roller guides, with their high precision and high stability, have become key components supporting high-end processing technologies such as five-axis composite processing machines, meeting the market's urgent demand for guides for complex processing forms. Miniaturization and lightweight requirements: In the fields of intelligent manufacturing and automated production, cross roller guides, with their compact structural design and lightweight characteristics, meet the market's urgent demand for miniature and lightweight linear guides, providing strong support for the innovative design of industrial products. Globally, cross roller guide companies are mainly distributed in Japan, Taiwan, Europe (Germany, Switzerland), South Korea and other countries. The top core companies include IKO Nippon, Thompson, HIWIN, THK, NSK, Bosch Rexroth, AirTAC, Schneeberger, Nippon Bearing, Union Tool and Won ST, among which the top 5 companies account for more than 65%.

The global Industrial Crossed Roller Guides market size was estimated at USD 896.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
