### Report Overview

Industrial Grade Plasma Rotating Electrode Atomization (PREA) Powder Making Equipment is a specialized manufacturing system used to produce high-purity, spherical metal powders through plasma melting and centrifugal atomization. This equipment utilizes a high-temperature plasma arc to melt a rotating electrode, which is then atomized into fine droplets by centrifugal force, solidifying into uniform spherical powders ideal for additive manufacturing (3D printing), thermal spray coatings, and advanced metallurgical applications. The process ensures precise control over particle size distribution, low oxygen content, and high sphericity, making it critical for industries requiring high-performance materials, such as aerospace, biomedical implants, and energy sectors. The equipment is characterized by its ability to handle reactive and refractory metals like titanium, nickel-based superalloys, and tungsten, offering superior powder quality compared to conventional gas or water atomization methods. Its industrial-grade designation emphasizes robustness, scalability, and automation for continuous production in demanding environments.
