Abstracts

Mechanical pressure switch is a common pressure sensor, usually used to detect changes in pressure and convert the signal into a mechanical or electrical signal. Its working principle is based on the mechanical structure. Through the deformation of the mechanical structure under the action of pressure, it realizes the detection and conversion of pressure signals. Mechanical pressure switches usually consist of a spring, piston and switch. When external pressure acts on the piston, the piston will experience a force causing it to move downward. The spring is connected to the piston. When the force on the piston exceeds the elastic limit of the spring, the spring will be squeezed, causing the switch to operate. This action can be used to control the opening and closing of a certain mechanical device to detect and control pressure.

The global Industrial Machinery Pressure Switch market size was estimated at USD 1250.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
