Report Overview

Inflammatory Point-of-Care Testing (POCT) refers to a range of rapid diagnostic tests used at or near the patient's location, which are designed to detect and measure inflammatory markers in the body. These tests are performed outside of a traditional laboratory setting and provide immediate results, enabling healthcare professionals to make prompt clinical decisions. Inflammatory POCT typically includes assays for C-reactive protein (CRP), procalcitonin, and other biomarkers associated with inflammation and infection. The purpose of these tests is to aid in the diagnosis of various conditions, such as infections, autoimmune diseases, and other inflammatory disorders, by providing a quick assessment of the body's inflammatory response.
