Report Overview

Infrared beacons are specialized electronic devices designed to emit infrared radiation, which is a type of electromagnetic wave with wavelengths longer than visible light but shorter than radio waves. These beacons are primarily used for various applications such as navigation, communication, and tracking. They work by transmitting a specific pattern or code of infrared signals that can be detected and interpreted by receivers equipped with infrared sensors. Infrared beacons are often employed in environments where line-of-sight is required, and they are particularly useful in situations where covert or secure communication is needed, as infrared signals are not easily intercepted or detected by unauthorized parties. They are commonly used in military, aerospace, and industrial settings, as well as in consumer electronics for applications like remote controls and motion detection.
