Abstracts

Infrared body temperature detectors are another form of light detector that are triggered by heat energy emitted by an intruder's body. This detector does not respond to changes in room temperature, either rising or falling. But when a target with a temperature approximately equal to the human body temperature (such as an intruder) enters a non-sensitive area from a sensitive area, the alarm can detect the difference in radiation and trigger an alarm.

The global Infrared Body Temperature Detector market size was estimated at USD 145.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of -3.20% during the forecast period.
