Report Overview

An Inline Check Valve is a mechanical device designed to regulate the flow of fluids within a piping system. It is specifically engineered to prevent the backflow of liquids or gases, ensuring that the flow is maintained in a single direction. The valve operates automatically, opening to allow fluid to pass in the intended direction and closing to prevent reverse flow when the pressure differential changes. This is achieved through a non-return mechanism, typically consisting of a disc or flap that is lifted by the flow and sealed against the valve seat when the flow stops or reverses. Inline Check Valves are commonly used in various applications, including water supply systems, industrial processes, and HVAC systems, to protect against backflow, maintain pressure, and prevent contamination. They are available in different materials and configurations to suit specific fluid types and system requirements, ensuring reliability and efficiency in fluid control.
