## Abstracts

Inoculant cored wire serves as a specialized tool in metallurgical processes, specifically designed to introduce inoculating agents into molten metal to modify its microstructure and improve its mechanical properties. Comprising a metal sheath enclosing a core of inoculant materials such as ferrosilicon, calcium, or rare earth metals, these wires are strategically inserted into the molten metal bath during casting or alloying processes. As the wire melts, the inoculant is released and dispersed evenly throughout the molten metal, promoting the formation of desirable phases and grain refinement. This results in enhanced mechanical strength, ductility, and other performance characteristics of the final product. Inoculant cored wire technology offers precise control over inoculation parameters, enabling metallurgists to tailor the microstructure and properties of metals and alloys to meet specific performance requirements in diverse industrial applications, including automotive, aerospace, and construction.

The global Inoculant Cored Wire market size was estimated at USD 173.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
