Abstracts

Inorganic feed mycotoxin binders and modifiers are substances added to animal feed to prevent or reduce the harmful effects of mycotoxins, which are toxic compounds produced by fungi that can contaminate grains, cereals, and other feed ingredients. Inorganic mycotoxin binders work by binding to the mycotoxins in the animal's gastrointestinal tract, preventing them from being absorbed into the bloodstream and causing health problems. Examples of inorganic binders include clays (such as montmorillonite) and zeolites (such as clinoptilolite). Inorganic mycotoxin modifiers, on the other hand, work by chemically altering the mycotoxin molecule and reducing its toxicity. Examples of inorganic modifiers include sodium bisulfite and sodium metabisulfite. Common mycotoxins found in animal feed include aflatoxins, deoxynivalenol (DON), zearalenone, and fumonisins, and they can cause a range of health problems in livestock, including reduced feed intake, immune suppression, reproductive issues, and even death. The use of inorganic mycotoxin binders and modifiers in animal feed is one approach to minimizing mycotoxin exposure and protecting animal health and welfare. The global inorganic feed mycotoxin binders and modifiers market refers to the market for products that are used to bind or modify mycotoxins in animal feed. These products typically include inorganic substances that have the ability to bind or modify mycotoxins, thereby reducing their harmful effects on animals.

The global Inorganic Feed Mycotoxins Binders and Modifiers market size was estimated at USD 2667.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
