Abstracts

Inorganic Scintillator Crystals are crystals grown in high temperature furnaces and are made of Alkali Halides (i.e., NaI, CsI) or Oxides (i.e., BGO), etc. They have scintillation properties by virtue of their crystalline structure. This structure creates the energy bands between which electrons can jump up to higher energy levels by excitation through ionizing radiation or down to lower energy levels by de-excitation through the emission of (visible) photons. The result is known as the scintillation effect. Some crystals need activators to enable scintillation emission in the visible part of the spectrum. An example of such an activator is Thallium (Tl), which is used in the best known and most frequently used Inorganic Scintillator: NaI(Tl).

The global Inorganic Scintillator Crystals market size was estimated at USD 221.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
