## Abstracts

Insulated metal substrate (IMS) consists of a metal baseplate (aluminium is commonly used because of its low cost and density) covered by a thin layer of dielectric (usually an epoxy-based layer) and a layer of copper (35  $\mu$ m to more than 200  $\mu$ m thick). The FR-4-based dielectric is usually thin (about 102  $\mu$ m) because it has poor thermal conductivity compared to the ceramics used in DBC substrates. Due to its structure, the IMS is a single-sided substrate, i.e. it can only accommodate components on the copper side. In most applications, the baseplate is attached to a heatsink to provide cooling, usually using thermal grease and screws. Some IMS substrates are available with a copper baseplate for better thermal performances. Compared to a classical printed circuit board, the IMS provides a better heat dissipation. It is one of the simplest ways to provide efficient cooling to surface mount components. The Insulated Metal Substrates industry can be broken down into several segments, Copper Based, Aluminum Based, etc. Global key players of Insulated Metal Substrates include AT&S, NHK, NCAB Group, Ventec, W?rthElektronik GmbH and TCLAD Inc, etc. Top two players occupy for a share about 15%. China is the largest market, with a share about 25%, followed by North America and Europe. In terms of product, Aluminum Based is the largest segment, with a share over 50%. In terms of application, Industrial Control is the largest market, with a share over 36%.

The global Insulated Metal Substrate (IMS) market size was estimated at USD 757.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.90% during the forecast period.
