### Report Overview

Insulin Glulisine Injection is a rapid-acting insulin analog used in the management of diabetes mellitus. It is a synthetic form of human insulin that closely mimics the natural insulin response to carbohydrate intake. This product is designed to be administered subcutaneously, typically just before or immediately after meals, to help regulate blood glucose levels in individuals with type 1 or type 2 diabetes. Insulin Glulisine Injection works by facilitating the uptake of glucose into cells, thereby reducing hyperglycemia. It has a faster onset and shorter duration of action compared to regular human insulin, making it suitable for controlling postprandial glucose levels. The product is available in various concentrations and is often prescribed in conjunction with a longer-acting insulin to provide basal coverage throughout the day.
