Abstracts

Integrated Saturation Diving Systems are specialized systems used in deep-sea diving operations, enabling divers to work at significant depths for extended periods without undergoing decompression after each dive. These systems maintain divers in a pressurized environment, where they live and work in saturation conditions, breathing a special gas mixture (typically helium and oxygen) at the same pressure as the underwater worksite. The system includes a pressurized living chamber, diving bell, life support systems, and control units, all integrated to ensure safety and efficiency. Saturation diving is commonly used in offshore oil and gas industries, underwater construction, and salvage operations where long-duration, deep-water work is required. The system minimizes decompression risks and maximizes operational time at depth.

The global Integrated Saturation Diving Systems market size was estimated at USD 162.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
