Report Overview

Interferon α -2a and α -2b are types of interferons, which are naturally occurring proteins produced by the body's immune system in response to viral infections and other pathogens. They play a crucial role in the regulation of immune responses and have antiviral, antiproliferative, and immunomodulatory effects. Interferon α -2a and α -2b are two specific subtypes of alpha interferons, which are further classified into two main groups: alpha and beta. Both α -2a and α -2b are recombinant forms of interferon α , meaning they are produced by genetically engineered cells to replicate the natural protein. These interferons are used in medical treatments for various diseases, including certain types of cancers and viral infections, due to their ability to inhibit viral replication and modulate the immune response. The primary differences between α -2a and α -2b lie in their glycosylation patterns and minor amino acid sequence variations, which can affect their pharmacokinetics, stability, and efficacy.
