Abstracts

Interferon therapy for chronic hepatitis B involves the use of interferon, particularly pegylated interferon-alpha, which is administered via injection and works by stimulating the immune system to target and destroy HBV-infected liver cells. Unlike antiviral medications that primarily suppress viral replication, interferon therapy can potentially lead to a sustained viral response and long-term remission after treatment ends. It is generally used for patients with chronic hepatitis B who have not achieved adequate results with antiviral drugs or who are suitable for its potential benefits.

The global Interferon Therapy Of Chronic Hepatitis B market size was estimated at USD 1350.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.85% during the forecast period.
