Abstracts

Interleukin inhibitors for psoriasis refer to a class of biologic medications that specifically target and inhibit interleukins. Psoriasis is characterized by an overactive immune response that leads to excessive production of cytokines such as interleukin-12 (IL-12), interleukin-23 (IL-23), and interleukin-17A (IL-17A), among others. IL inhibitors work by blocking these specific interleukins or their receptors, thereby interrupting the inflammatory cascade responsible for the skin lesions and systemic symptoms associated with psoriasis.

The global Interleukin Inhibitors For Psoriasis market size was estimated at USD 15123.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
