## Abstracts

Intermittent freeze-drying machine is a specialized piece of equipment used in the food and pharmaceutical industries for the preservation and dehydration of various products. It operates by subjecting the product to low temperatures while under vacuum, causing the water content to freeze. This frozen water is then sublimated, transforming it from a solid to a gas, resulting in the removal of moisture from the product. The intermittent aspect refers to the periodic operation of the machine's freezing and drying processes, allowing for efficient processing of large quantities of products.

The global Intermittent Freeze Drying Machine market size was estimated at USD 125.6 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.25% during the forecast period.
