Abstracts

Intermittent Pneumatic Compression (IPC) Pump is a medical device designed to improve blood circulation and reduce the risk of blood clots, particularly in patients with limited mobility or those recovering from surgery. The device consists of inflatable cuffs or sleeves that are wrapped around the limbs and connected to a pump. The pump inflates and deflates these cuffs in a controlled sequence, applying intermittent pressure to the limbs to mimic natural muscle contractions. This helps stimulate blood flow, prevent deep vein thrombosis (DVT), and manage conditions such as lymphedema by reducing swelling and improving lymphatic drainage. IPC pumps are widely used in hospitals, clinics, and home care settings.

The global Intermittent Pneumatic Compression Pump market size was estimated at USD 873.08 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.10% during the forecast period.
