Report Overview

Internal Nasal Splints are medical devices designed to provide structural support and stabilization to the nasal septum and surrounding structures within the nasal cavity. They are typically made from materials such as silicone or other biocompatible polymers and are inserted into the nostrils to help correct deformities, alleviate breathing difficulties, or maintain the position of the nasal structures post-surgery. These splints work by gently holding the nasal tissues in place, allowing for proper healing and reducing the risk of complications such as bleeding or displacement of the nasal septum.
