Abstracts

Internal pressure ultrafiltration membrane is a filtration method of ultrafiltration membrane. Its principle is that the raw liquid first enters the inside of the hollow fiber of the ultrafiltration membrane, and is driven by the pressure difference to penetrate through the hollow fiber from the inside to the outside in the radial direction to become the permeate. The concentrated liquid remains inside the hollow fiber and flows out from the other end. The internal pressure ultrafiltration membrane has the characteristics of strong pollution resistance, high membrane fiber strength and high interception accuracy. It is suitable for treating various types of groundwater, slightly polluted surface water, municipal sewage/industrial wastewater reuse treatment, seawater desalination pretreatment and other occasions. .

The global Internal Pressure Ultrafiltration Membrane market size was estimated at USD 850.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
