Abstracts

The internal heating soldering iron is another common electronic welding tool. Its characteristic is that the heating resistor (i.e. the soldering iron core) is installed inside the soldering iron tip, and the heat is directly transferred to the soldering iron tip by internal heating. The internal heating soldering iron consists of a handle, a connecting rod, a spring clip, a soldering iron core, and a soldering iron tip. Since the soldering iron core is installed inside the soldering iron tip, it has the advantages of fast heating and high heat utilization. The common specifications of the internal heating soldering iron include 20W, 50W, etc. Although its power seems not high, due to its high thermal efficiency, a 20W internal heating soldering iron may be equivalent to a 40W external heating soldering iron in actual use.

The global Internally Heating Electric Soldering Iron market size was estimated at USD 125.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.15% during the forecast period.
