### Report Overview

Intra-Aortic Balloon Catheters (IABP) are medical devices used in the treatment of patients with severe heart conditions, particularly those experiencing acute myocardial infarction, cardiogenic shock, or refractory angina. These catheters are inserted into the aorta, typically through the femoral artery, and consist of a balloon that inflates and deflates in synchronization with the patient's heartbeat. The primary function of the IABP is to augment cardiac output and reduce the workload on the heart by providing counterpulsation. During diastole, the balloon inflates, increasing blood flow to the coronary arteries and other vital organs. Conversely, during systole, the balloon deflates, reducing the resistance against which the heart must pump. This mechanism helps to improve oxygen supply to the heart muscle and reduces the risk of complications in patients with compromised cardiac function. IABPs are often used as a temporary measure before more definitive treatments, such as coronary artery bypass grafting or heart transplantation, can be implemented.
