Report Overview

The Intracranial Expansion Stent is a medical device designed for the treatment of intracranial aneurysms and other cerebrovascular diseases. It is a small, flexible, and self-expanding mesh tube made of biocompatible materials such as nitinol, which allows it to conform to the shape of the blood vessel. The stent is inserted into the affected blood vessel through a minimally invasive procedure, such as a catheterization, and is deployed to fill the aneurysm sac, redirecting blood flow and promoting the formation of a thrombus to prevent rupture. The Intracranial Expansion Stent is engineered to provide structural support to the vessel wall, reduce the risk of aneurysm regrowth, and maintain long-term patency of the blood vessel. It is typically used in conjunction with other endovascular techniques, such as coiling, to achieve optimal therapeutic outcomes.

In 2024, the global Intracranial Expansion Stent market is projected to reach approximately USD xx Million, with expectations to grow at a compound annual growth rate (CAGR) of around xx between 2024 and 2033.
