Abstracts

An Intraoperative Nerve Monitoring (IONM) System is a medical technology used during surgeries to monitor the functional integrity of nerves in real time. It helps surgeons identify and protect critical neural structures, such as motor and sensory nerves, by providing continuous feedback about nerve activity. This is especially important in complex procedures, such as neurosurgery, spinal surgery, and head and neck surgeries, where accidental nerve damage can lead to complications like paralysis, loss of sensation, or impaired bodily functions. The system uses electrical stimulation and recording techniques to track nerve signals, reducing the risk of injury and improving patient outcomes by enabling timely corrective actions during surgery.

The global Intraoperative Nerve Monitoring System market size was estimated at USD 346.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
