The intraoral screen fluorescent screen scanner is a device used in the field of stomatology, and is usually used for early detection and diagnosis of oral lesions. The scanner scans images of tissues and cells inside the mouth and displays them on a screen. It uses the reflection and absorption of specific wavelengths of fluorescent light by the tissues and cells in the oral cavity to generate images, thereby helping stomatologists or dentists to diagnose and treat diseases. Compared with traditional oral examination methods, intraoral screen fluorescent screen scanners can provide more accurate, fast and non-invasive diagnosis, avoiding discomfort and pain for patients. The scanner can help stomatologists or dentists to detect oral lesions and oral cancers in time, improve the early diagnosis and treatment rate of oral diseases, thereby promoting oral health and general health.
