Report Overview

Neuromodulation is a medical treatment approach that involves the alteration of nerve activity through targeted delivery of a stimulus, such as electrical, magnetic, or chemical agents, to specific areas of the nervous system. This intervention aims to modulate or change the way nerve cells communicate with each other, thereby potentially reducing or eliminating symptoms associated with various neurological disorders. The technique is employed in the treatment of chronic pain, epilepsy, Parkinson's disease, and other conditions where traditional therapies have been ineffective. Neuromodulation can be invasive, such as spinal cord stimulation or deep brain stimulation, or non-invasive, like transcranial magnetic stimulation. The goal of neuromodulation is to provide symptom relief, improve quality of life, and potentially promote neural plasticity for long-term therapeutic benefits.
