Report Overview

Iodine-131 isotope, also known as I-131, is a radioactive isotope of the chemical element iodine. It is produced as a fission product in nuclear reactors and as a byproduct of nuclear weapons testing. Iodine-131 is a beta and gamma emitter, meaning it decays by emitting beta particles and gamma radiation. This isotope has a half-life of approximately 8.02 days, which means that half of the radioactive atoms will decay into stable xenon-131 within this time frame. Iodine-131 is used in medical applications, particularly in the treatment of thyroid disorders, as it is selectively absorbed by the thyroid gland. It is also used in diagnostic procedures to assess thyroid function and to detect the presence of thyroid cancer. Due to its radioactive nature, Iodine-131 poses potential health risks if not handled and administered properly, and it is essential to follow strict safety protocols during its use.

In 2024, the global Iodine-131 Isotope market is projected to reach approximately USD xx Million, with expectations to grow at a compound annual growth rate (CAGR) of around xx between 2024 and 2033.
