Abstracts

Ion exchange membrane for iron-chromium batteries is an ion exchange membrane used in iron-chromium batteries to isolate the electrolyte between the anode and cathode, preventing the two electrolytes from mixing while allowing ions to pass through. Iron-chromium battery is a kind of secondary battery. Its working principle is to convert iron and chromium between different oxidation states to achieve the storage and release of electrical energy. In the charged state, the anode of the iron-chromium battery is chromate and the cathode is iron hydroxide, and the two are separated by an ion exchange membrane. In the discharge state, chromate is reduced to trivalent chromium ions, and ferric hydroxide is oxidized to ferric ions, which move to the anode and cathode through the ion exchange membrane to generate electrical energy. Ion exchange membranes for iron-chromium batteries need to have good chemical stability, corrosion resistance and electrical conductivity to ensure their stability and reliability in long-term use.

The global Ion Exchange Membrane For Iron Chromium Battery market size was estimated at USD 21.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.80% during the forecast period.
