Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on ITO Films for Capacitive Touch Screens competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. ITO thin films used in capacitive touchscreens are transparent conductive layers of indium tin oxide deposited on glass or plastic substrates using processes such as magnetron sputtering. They possess both high light transmittance and low resistance, forming X/Y electrodes and sensing circuitry to accurately capture touch signals from fingers, capacitive pens, etc. Upstream industries include ITO targets, glass/plastic substrates, sputtering equipment, and photolithography and etching chemicals; downstream industries primarily consist of capacitive touchscreen module manufacturers, ultimately applying their technology to mobile phones, tablets, automotive central control systems, and industrial control displays. In 2024, the global market price for ITO thin films used in capacitive touchscreens was \$18/?, with sales of approximately 118.8 million? and global production capacity of 120-150 million?. The industry profit margin was 15-20%.

Global Market Future Development Trends

The global ITO film market for capacitive touchscreens will steadily grow with the continued expansion of smart terminals and automotive screens. 5G smartphones, high refresh rate tablets, and foldable devices will drive demand for higher resolution and thinner touchscreens, propelling the upgrade and structural innovation of high-performance, low-resistance ITO films. Technically, upstream target purity and sputtering processes will be further optimized to reduce sheet resistance, improve visible light transmittance, and ensure adhesion to flexible substrates. Simultaneously, applications such as ultra-narrow bezels, full-screen displays, and foldable and curved displays place higher demands on the refinement of ITO patterns and stress control, driving the evolution of processes towards higher precision and lower defects. In terms of the competitive

landscape, ITO films face replacement pressure from new transparent conductive materials such as metal meshes, silver nanowires, and oxide/conductive polymers. In the short term, ITO will still dominate due to its mature supply chain and cost advantages, but in the medium to long term, it will evolve towards composite solutions such as "ITO + metal mesh" and "ITO + functional coating" to balance performance, cost, and resource sustainability.

The global ITO Films for Capacitive Touch Screens market size was estimated at USD 2138.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.00% during the forecast period.
