Report Overview

A Jejunal Feeding Tube is a medical device designed to provide enteral nutrition directly into the jejunum, the middle portion of the small intestine. This type of tube is typically used for patients who cannot receive nutrition through the mouth or stomach due to various medical conditions, such as gastrointestinal disorders, or those who are at high risk for aspiration. The jejunal feeding tube bypasses the stomach, reducing the risk of complications like reflux and aspiration pneumonia. It is inserted through the nose or mouth and guided into the jejunum using fluoroscopy or endoscopy. The tube allows for the controlled delivery of nutrients, medications, and fluids, ensuring that patients receive adequate nourishment and hydration, especially when oral intake is not possible or safe.
