Report Overview

The Jet Fuel Thermal Oxidation Tester is a sophisticated laboratory instrument designed to evaluate the thermal stability of jet fuels. This device is crucial for assessing the tendency of jet fuel to undergo oxidation, which can lead to the formation of gum and sediment, adversely affecting engine performance and fuel system reliability. The tester subjects the fuel sample to a controlled heating process, typically at a temperature of 95°C for a specific duration, and then measures the amount of insoluble material formed. The results provide insights into the fuel's resistance to thermal degradation, which is essential for ensuring the quality and safety of aviation fuel. This tester is widely used in the aviation industry, fuel production facilities, and regulatory agencies to maintain stringent quality control standards and to comply with international specifications for jet fuels.
