### Report Overview

Kaposi sarcoma (KS) is a type of cancer caused by human herpesvirus 8 (HHV-8) that primarily manifests as lesions on the skin, mucous membranes, lymph nodes, or internal organs, with four distinct subtypes: classic, endemic, iatrogenic, and epidemic (AIDS-associated). The treatment market for Kaposi sarcoma is driven by the prevalence of HIV/AIDS, as epidemic KS remains the most common form, particularly in regions with high HIV incidence, such as sub-Saharan Africa. Treatment approaches vary based on disease severity and immune status, ranging from antiretroviral therapy (ART) for HIV-positive patients to localized therapies (e.g., radiation, cryotherapy) for mild cases, and systemic treatments (e.g., liposomal doxorubicin, paclitaxel, or immunotherapy) for advanced or aggressive disease. The market is influenced by advancements in oncology and HIV care, with increasing adoption of targeted therapies and immunomodulators. However, access to treatment remains a challenge in low-resource settings, where diagnostics and specialized care are limited. Pharmaceutical companies and research organizations continue to explore novel therapies, including immune checkpoint inhibitors and gene-based treatments, to improve outcomes for KS patients. The competitive landscape includes key players like Johnson & Johnson, Bristol-Myers Squibb, and Merck, alongside emerging biotech firms focusing on precision medicine. Regulatory approvals, healthcare infrastructure, and funding for HIV-associated cancers significantly shape market dynamics.
