Report Overview

A laminated spring is a type of mechanical spring made by stacking multiple layers of material, typically metal, to form a composite structure. This design allows for greater flexibility and strength, as the layered construction can distribute stress more evenly across the spring, reducing the risk of failure under load. Laminated springs are commonly used in applications where high durability and load-bearing capacity are required, such as in automotive suspensions and heavy machinery. The layers can be bonded together or left unbonded, depending on the desired spring characteristics and application requirements.
