Report Overview

Laminoplasty Plate is a surgical implant designed to treat spinal conditions, particularly those involving the cervical spine. This medical device is typically made from materials such as titanium or polyetheretherketone (PEEK), which are biocompatible and provide structural support without causing adverse reactions in the body. The primary function of the Laminoplasty Plate is to maintain the stability and alignment of the spinal column during and after the laminoplasty procedure. This procedure involves the removal or reshaping of the lamina, the bony arches that protect the spinal cord, to alleviate pressure on the spinal cord or nerves. The Laminoplasty Plate is used to reconstruct and secure the lamina, allowing for proper healing and preventing the recurrence of spinal compression. It is an essential tool in spinal surgery, facilitating the restoration of spinal function and relieving pain in patients with conditions such as spinal stenosis or degenerative disc disease.
