Report Overview

A Landfill Lining System is a crucial environmental engineering component designed to protect the surrounding environment from contaminants contained within a landfill. It typically consists of multiple layers, including a compacted clay liner and a synthetic geomembrane, which act as barriers to prevent leachate—a liquid that can contain harmful chemicals—from seeping into the soil and groundwater. The system may also include drainage layers to manage leachate and gas collection systems to control the release of landfill gases. By preventing the migration of pollutants, landfill lining systems help mitigate environmental pollution and ensure the safe long-term disposal of waste.
