Abstracts

Lanthanum hexaboride electron microscope, as a type of electron microscope, its key component is that the electron gun uses lanthanum hexaboride (LaB6) material. Lanthanum hexaboride (LaB6) is an electron emission material with high brightness and high stability. Its work function is low (2.4eV), so that at the same current density, the lanthanum hexaboride electron gun only needs a lower heating temperature (such as 1500K) to reach the working state, and the brightness is higher. Transmission electron microscopes equipped with lanthanum hexaboride electron guns usually have high resolution (point resolution can reach 0.19nm, lattice fringe resolution can reach 0.14nm) and fast sample change capability (such as 3 minutes fast sample change). This type of microscope can observe and analyze the microstructure of various materials, including morphology observation, high-resolution electron microscopy research, electron diffraction, etc., and can perform nanoscale micro-area analysis. The equipped X-ray energy spectrometer can perform elemental analysis of the area of ??interest in real time.

The global Lanthanum Hexaboride Electron Microscope market size was estimated at USD 125.3 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.45% during the forecast period.
