Abstracts

The large-angle closed-loop miniature galvanometer is a miniature optical device used to control and adjust the direction and deflection angle of the beam. It usually consists of a tiny mirror and a set of drive and feedback control systems. The large-angle closed-loop micro-galvanometer can quickly and accurately change the direction and deflection angle of the beam in a short time. Its working principle is to change the position or angle of the tiny mirror by applying an electric field or current, thereby changing the incident angle and reflection direction of the beam. Through the feedback control system, the position and angle of the tiny mirrors can be monitored and adjusted in real time to achieve closed-loop control and precise beam deflection. Large-angle closed-loop micro-galvanometers have many applications, including optical communications, optical imaging, spectral analysis, and lidar. In optical communication, it can be used for functions such as fiber coupling, beam deflection, and optical path selection. In optical imaging, it can be used in applications such as scanning microscopes, optical cameras, and optical projection. In spectral analysis, it can be used in spectrometers and spectral imaging systems. In lidar, it can be used for beam deflection and object detection. The large-angle closed-loop micro-galvanometer has the advantages of fast response, high precision and stability, and can realize high-speed and high-precision beam control and adjustment. Its small size and low power consumption also make it widely used in miniaturized and portable devices.

The global Large Angle Closed Loop Miniature Galvanometer market size was estimated at USD 85.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.65% during the forecast period.
