Report Overview

The laser methane detection module is an advanced gas detection device that utilizes tunable diode laser absorption spectroscopy (TDLAS) technology to accurately measure methane (CH₄) concentrations in real-time. It operates by emitting a laser beam that interacts with methane molecules, detecting absorption patterns to determine gas levels with high precision, typically in parts per million (ppm). These modules are compact, durable, and designed for integration into fixed or portable systems, offering non-contact, long-distance detection capabilities. Widely used in industries such as oil & gas, utilities, and environmental monitoring, they provide early leak detection, ensuring safety and regulatory compliance. Their advantages include immunity to interference from other gases, low maintenance requirements, and the ability to perform continuous monitoring in harsh environments.
