Abstracts

Laser non-polarizing cubic beamsplitter is an optical component usually composed of two glass prisms. It can divide the incident light into two beams of equal intensity, one is the reflected beam and the other is the transmitted beam. Unlike polarizing beamsplitters, laser non-polarizing cubic beamsplitters do not cause the polarization effect of light, that is, they do not change the polarization state of the beam. Laser non-polarizing cube beamsplitters usually consist of two glass prisms with specific optical coatings. These optical coatings make the intensity of reflected light and transmitted light equal by reflecting and transmitting light beams on the glass surface without changing the polarization state of the light beam. Therefore, regardless of the polarization state of the incident light, the laser non-polarizing cubic beam splitter is able to evenly split the beam into two beams of equal intensity.

The global Laser Non Polarizing Cubic Beamsplitter market size was estimated at USD 45.2 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
