Abstracts

Laser projection display technology (LDT) is a display technology that uses red, green and blue (RGB) three primary color lasers as light sources. This technology projects images onto a specific surface by utilizing the highly focused, monochromatic and orderly arranged characteristics of laser beams. The color gamut coverage of laser display can reach more than 90% of the color space that the human eye can recognize, which is more than twice the color gamut coverage of traditional displays. This enables laser projection display technology to reproduce the rich and bright colors of the objective world most realistically, providing more shocking expression. Compared with the light sources such as incandescent lamps or LEDs used in traditional projectors, laser projection uses lasers as light sources, which can achieve higher brightness and color vividness. Laser projection technology can achieve very large projection sizes without reducing image quality, so it has greater flexibility.

The global Laser Projection Display Technology Ldt market size was estimated at USD 1245.3 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.45% during the forecast period.
