Report Overview

A Laser Speckle Imaging System is a sophisticated optical imaging technology that utilizes the principles of laser speckle to capture and analyze dynamic changes in a scene or object. This system typically consists of a laser source, a camera, and specialized software for processing the speckle patterns. The laser light is projected onto the subject, creating a random interference pattern known as speckle. As the subject moves or changes, these speckle patterns shift, and the camera captures these changes. The system's software then analyzes the variations in the speckle patterns to extract information about the subject's motion, deformation, or other dynamic properties. This technology is widely used in various fields, including biomedical research, materials science, and industrial quality control, to non-invasively monitor and measure physical changes with high precision and real-time feedback.
