Abstracts

Lead-free low-temperature solder paste is a specialized soldering material designed to melt and form reliable joints at lower temperatures compared to standard lead-free solder pastes. Typically composed of bismuth-tin (Bi-Sn) or bismuth-tin-silver (Bi-Sn-Ag) alloys, this type of solder paste is ideal for applications where heat-sensitive components or substrates are used, as it reduces the risk of thermal damage during the soldering process. The flux within the paste ensures good wetting and bonding properties, even at these reduced temperatures. Lead-free low-temperature solder paste is particularly beneficial in industries such as consumer electronics, medical devices, and flexible electronics, where minimizing thermal stress is crucial for maintaining the integrity and performance of delicate components. Additionally, this solder paste supports environmentally friendly manufacturing practices by complying with regulations like the Restriction of Hazardous Substances (RoHS) directive, making it a sustainable choice for modern electronic assembly.

The global Lead Free Low Temperature Solder Paste market size was estimated at USD 385.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
