Report Overview

Leg prosthetics, also known as artificial legs or lower limb prosthetics, are medical devices designed to replace the function of a missing or amputated limb below the knee (transtibial) or above the knee (transfemoral). These devices are engineered to provide support, stability, and mobility to individuals who have experienced limb loss due to various reasons such as accidents, disease, or congenital conditions. Leg prosthetics are crafted from materials like carbon fiber, titanium, and silicone, and are custom-fitted to each user to ensure optimal comfort and functionality. They often incorporate advanced features such as microprocessor-controlled knee joints, which adapt to the user's gait and activities, and cosmetic covers that mimic the appearance of a natural limb. The primary goal of leg prosthetics is to restore the individual's ability to walk, engage in daily activities, and maintain an active lifestyle, while also addressing psychological and social aspects of limb loss.
