Report Overview

Leukotriene antagonists, also known as leukotriene receptor antagonists (LTRAs), are a class of medications primarily used to treat asthma and allergic rhinitis. These drugs work by blocking the action of leukotrienes, which are inflammatory mediators released during an allergic reaction. Leukotrienes cause bronchoconstriction, mucus production, and increased vascular permeability, leading to the symptoms of asthma and allergic rhinitis. Leukotriene antagonists, such as montelukast and zafirlukast, bind to leukotriene receptors on cells, preventing leukotrienes from binding and thus reducing inflammation and constriction in the airways. This class of drugs is particularly effective in patients with mild to moderate asthma and those with aspirin-exacerbated respiratory disease. They are also used as an adjunct therapy in combination with other asthma medications to improve lung function and reduce the frequency of asthma exacerbations.
