Report Overview

A lifetime fluorometer is an analytical instrument used to measure the fluorescence lifetime of a fluorophore. Fluorescence lifetime refers to the average time a fluorophore spends in its excited state before returning to the ground state by emitting a photon. The lifetime fluorometer typically excites the sample with a light source of a specific wavelength, and then measures the time delay between the excitation pulse and the emitted fluorescence signal. This delay provides information about the dynamic processes occurring within the sample, such as molecular interactions, structural changes, or environmental conditions. Lifetime fluorometers are widely used in various fields including biochemistry, biophysics, pharmaceuticals, materials science, and environmental monitoring for studying molecular interactions, protein dynamics, cellular processes, and other fluorescence-based phenomena.
