Report Overview

A Liquid Crystal on Silicon (LCoS) chip is a type of display technology that combines liquid crystal displays with a silicon backing. This technology involves liquid crystal layers placed on top of a reflective silicon chip, which acts as a high-resolution light modulator. The silicon chip's surface contains a grid of tiny mirrors that reflect light modulated by the liquid crystals. When electrical signals are applied, the liquid crystals adjust to control the light passing through or reflecting from the mirrors, creating images with high resolution and contrast. LCoS chips are used in various applications, including projectors, head-mounted displays, and microdisplays, offering high image quality, vibrant colors, and precise detail due to their ability to handle high pixel densities.
