Abstracts

The core components of the CT ball tube are the anode target surface and bearings. The bearing mainly plays a role in supporting the rotation of the rotor and reducing the friction coefficient of motion. In order to prevent the failure of the shaft caused by the high temperature conduction effect of the anode, liquid metal bearings have been used, and by replacing traditional steel ball bearings with liquid metal filling, rolling bearings are transformed into sliding bearings, which have higher heat dissipation efficiency and achieve zero wear and vibration, significantly extending the bearing life. Due to the inherent technological advantages of liquid metal bearing technology, various CT tube manufacturers have followed suit, resulting in the technology becoming particularly popular in recent years.

The global Liquid Metal Bearing Lmb X Ray Tube market size was estimated at USD 185.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
