Report Overview

Liquid Molded Underfill (LMU) is a specialized type of underfill material used in the electronics industry, particularly for flip chip and ball grid array (BGA) applications. It is designed to enhance the mechanical stability and reliability of semiconductor devices by providing a robust bond between the chip and the substrate. LMU is applied as a liquid and then cured in place, forming a solid, protective layer that helps to dissipate stress and manage thermal expansion mismatches between the chip and the printed circuit board (PCB). This process is crucial for improving the overall performance and longevity of electronic devices, especially those subjected to harsh environmental conditions or high mechanical stress. The material is typically made from epoxy or silicone-based resins and is chosen for its ability to flow into the gap between the chip and the substrate, filling any voids and providing a uniform layer of protection.

In 2024, the global Liquid Molded Underfill market is projected to reach approximately USD xx Million, with expectations to grow at a compound annual growth rate (CAGR) of around xx between 2024 and 2033.
