### Report Overview

Liquid Penetrant Testing (LPT) is a non-destructive testing method used to detect surface defects in materials such as cracks, porosity, and leaks in various components and structures. This technique involves the application of a colored or fluorescent liquid penetrant to the surface of the material, which then seeps into any discontinuities present. After a short dwell time, the excess penetrant is removed, and a developer is applied. This developer draws the penetrant out of the defects, making them visible under ultraviolet light or normal lighting, depending on the type of penetrant used. LPT is widely used in industries such as aerospace, automotive, and nuclear power to ensure the integrity and safety of critical components and structures.
